

CSI 394

intro - use some lists!

1. Read in how many numbers the user will enter
2. Read in a list of numbers from the user. (Use input)
3. Put them in a list. (Perhaps use append)
4. Average the list of numbers and output the result
5. Now try to average every pair of numbers and put them into a new list. For example, if the user enters [3, 2, 5, 4] Then your code would make a new list that is [2, 4] which is the average of 3 and 2 followed by the average of 5 and 4.
6. Print this new list.
